

Power Conditioner of the Year

Torus Power TOT AVR

The Torus Power TOT AVR power conditioner is a very well engineered huge toroidal transformer built into a solid chassis. It can power up to three 4A devices and has three sets of three-pin 13A sockets for UK users. It can be controlled by a RS232 link, and looks and sounds more than good enough to be used as a standalone power conditioner for small-to-medium sized audio systems. In listening, Alan Sircom said, "You'll hear the improvement in the first few bars of music played with the TOT AVR in place, and you'll hear it taken away when it's removed. A ten minute demonstration would seal the deal and the majority of people would buy one at the end of it." It's that simple, and that good!
